### Notes:

Dimensions may be subject to change based on material available at time of order

Our Jib Cranes have been pre-engineered with a 15% impact allowance for electric hoist and designed to be load tested at 125% at L over 300. If installed correctly onto a concrete floor with a minimum thickness of 6" with strength of 3,000 PSI using a 2-part epoxy anchors system and under the supervision of a "Professional Engineer", no foundation is required. This procedure should definitely be confirmed by an engineer in your State or Province.

All welding has been done by "The Dressor Group Ltd." a CSA W59 Certified Company Certified to CSA W47.1.
